Mathematics of Optimization 1

Unconstrained Optimization 1.1

- First order conditions: $\frac{\delta f}{\delta x} = 0, \frac{\delta f}{\delta y} = 0$
- Second order conditions: $\frac{\delta^2 f}{\delta x^2} < 0, \frac{\delta^2 f}{\delta y^2} < 0$
- Additionally, $\left(\frac{\delta^2 f}{\delta x^2} \times \frac{\delta^2 f}{\delta u^2}\right) \left(\frac{\delta^2 f}{\delta x \delta u}\right)^2 > 0$

Example:
$$G(T, C) = 50 + 10T + 16C - T^2 - 2TC - 2C^2$$

$$\frac{\delta G}{\delta T} = 10 - 2T - 2C$$

$$\begin{bmatrix}
\frac{\delta G}{\delta C} = 16 - 2T - 4C \\
-2 \quad -2 \quad -10 \\
-2 \quad -4 \quad -16
\end{bmatrix}
\Rightarrow
\begin{bmatrix}
-2 \quad -2 \quad -10 \\
0 \quad -2 \quad -6
\end{bmatrix}
\Rightarrow
\begin{bmatrix}
-2 \quad 0 \quad -4 \\
0 \quad -2 \quad -6
\end{bmatrix}$$

$$\Rightarrow T = 2, C = 3$$

$$\Rightarrow T = 2, C = 3$$

$$\frac{\delta^2 G}{\delta T^2} = -2 < 0$$

$$\frac{\delta^2 G}{\delta C^2} = -4 < 0$$

$$\left(\frac{\delta^2 G}{\delta T^2} \times \frac{\delta^2 G}{\delta C^2}\right) - \left(\frac{\delta^2 G}{\delta T \delta C}\right)^2 = (-2 \times -4) - (-2)^2 = 8 - 4 = 4 > 0$$

$$\Rightarrow G(2,3)$$
 is a maximum $\Rightarrow G(2,3) = 50 + 20 + 48 - 4 - 12 - 18 = 84$

Constrained Optimization 1.2

To find the critical points of f(x) subject to some constraints g(x) = c we have

$$\begin{bmatrix} \frac{\delta f}{\delta x} &= \lambda \frac{\delta g}{\delta x} \\ \frac{\delta f}{\delta y} &= \lambda \frac{\delta g}{\delta y} \\ g(x) &= c \end{bmatrix}$$
 Example: $T = 19.25 - 6 \ln(R) - 4 \ln(W)$, constraint is $R + W = 5$
$$\begin{bmatrix} 19.25 - \frac{6}{R} &= \lambda \\ 19.25 - \frac{4}{W} &= \lambda \\ R + W &= 5 \end{bmatrix}$$

$$19.25 - \frac{6}{R} = 19.25 - \frac{4}{W} \Rightarrow 6W = 4R$$

$$W = 5 - R \Rightarrow 6(5 - R) = 4R \Rightarrow 30 - 6R = 4R \Rightarrow 10R = 30 \Rightarrow R = 3, W = 2$$

$$T(3, 2) = 19.25 - 6 \ln(3) - 4 \ln(2) \approx 9.89$$
